Chapter 1

Introduction

This is the introduction of my PhD thesis.

Test list of symbols with E .

Chapter 2

Basics of accelerator beam dynamics

Chapter 3

Theory of Crab Cavity noise induced emittance growth

Chapter 4

First experimental campaign in the SPS

In 2018, two prototype Crab Cavities (CCs) were installed in the SPS to be tested for the first time with proton beams. One of the operational issues that needed to be addressed concerned the expected emittance growth due to noise in their RF control system. A theoretical model had already been developed and validated by tracking simulations [1]. Based on those studies a dedicated experiment was performed to benchmark the models with experimental data and to confirm the analytical predictions. In particular, the idea was to inject various noise levels in the CC RF system and record the emittance evolution. In this chapter, the measurement results from the experiment are presented and discussed.

Chapter 5

Investigation of the discrepancy

Chapter 6

Simple model of describing the decoherence suppression from impedance

Chapter 7

Application and impact for HL-LHC

Chapter 8

Conclusion
